

2016 Kentucky Soybean Variety Performance Tests

Claire M.-P. Venard and Joshua Duckworth, Plant and Soil Sciences

The Kentucky Soybean Variety Performance Tests are conducted to provide an unbiased and objective estimate of the relative performance of soybean varieties sold in Kentucky. This information may be used by growers and seed producers to aid in selecting varieties that will give the highest total production in a specific situation. Soybean cultivars in the 2016 tests were entered by soybean growers, commercial companies, and state and federal institutions.

Forty soybean tests were planted in 2016 in Kentucky, at the eight test locations shown below. Test locations, planting and harvest dates are shown in Table 1.

Methods

All tests were planted in a randomized complete block design by maturity group with a specially built no-till plot planter. The tests (Tables 6 through 10) had three replications (plots) for each variety. The individual plots were 20 feet long and six rows wide with 15 inches between rows. The seeding rate was four to five viable seeds per foot of row, at a planting depth of 1.5 inch. All plots were treated with fertilizers and herbicides before planting, and

maintained as weed-free as possible during the growing season. All plots were chemically end-trimmed to 16 feet approximately one month after planting.

Seed source information is located on page 4. Companies could choose to treat their seed with fungicides, insecticides, nematicides, beneficial organisms, and/or germination/growth/systemic acquired resistance enhancers (Table 3). The treatment codes are provided in Table 4.

Harvesting was done with a small plot combine (Wintersteiger Delta plot combine—intersteiger, USA) according

to maturity. Sixteen feet of the four center rows were harvested from the plots.

Yield is reported in bushels (60 pounds) per acre adjusted to 13% moisture. An electronic weight and moisture monitor (HarvestMaster HM800 GrainGage system, Juniper Systems, Inc., USA) located on the combine was used for monitor weight and moisture readings for each plot. Data were collected with a field computer (Allegro Mx, Juniper Systems, Inc., USA) connected to the monitor and analyzed with Agrobase GEN II statistical software (Agronomix Software Inc., Canada).

Location of the 2016 Kentucky Soybean Variety Performance Tests

1. Breckinridge County (Lincoln Trail)
2. Butler County (Mammoth Cave)
3. Caldwell County (Pennyrile)
4. Calloway County (Purchase)
5. Cumberland County (Lake Cumberland)
6. Fayette County (Bluegrass)
7. Hancock County (Green River)
8. Russell County (Lake Cumberland)

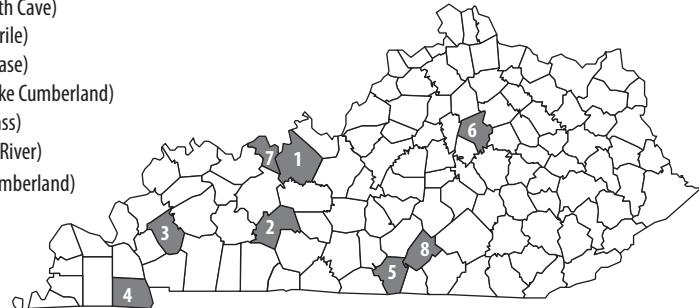

Table 1. Locations, planting and harvest dates for the 2016 Kentucky Soybean Variety Performance Tests

TEST SITE	REGION	COLLABORATORS	PLANTING DATE(S)	AG. PRACTICE	HARVEST DATES
Breckinridge County	Lincoln Trail	Mr. Capnton - soybean producer Carol Hinton - UK County Extension Agent for Agriculture and Natural Resources	6/10/2016	No-till	MG II, III, IV Early: 10/12/2016 MG IV Late, V: 11/02/2016

Table 11. Fayette County	26
Table 12. Hancock County	30
Table 13. Russell County	32

Lodging was recorded at harvest. Lodging was rated on a scale of 1 to 5, where 1 = almost all plants erect; 2 = all plants over slightly or a few down; 3 = all plants over moderately or 25% down; 4 = all plants over considerably or 50% to 80% down; 5 = all plants down.

Maturity date. A variety was considered mature when 99% of the pods have turned their normal mature color. (One to two weeks of good drying weather may be needed beyond the date given before the beans were ready to combine.) Maturity dates were recorded at the Fayette County location.

Plant height was measured in inches from the soil surface to the tip of the main stem. Plant height was recorded at the Fayette County location, at harvest.

Disease ratings. Diseases may cause yield loss if soybean plants are infected prior to flowering. Planting disease-resistant or disease-tolerant varieties will help eliminate this possible yield loss. Growers should review Table 3 (Company specifications) for disease resistance/tolerance ratings. In addition to the company specifications, the test plot fields were scouted every other week during the soybean growing season for disease. During the 2016 season, frogeye leaf spot (FLS) was observed at all of the Kentucky Soybean Variety Performance Test sites. Disease ratings for FLS were taken during the third week of August in Calloway County and Russell County, where the disease developed enough to potentially affect yield. The disease ratings are presented in table 10 (Calloway) and 14 (Russell).

Protein, Oil. Variety protein and oil concentrations are reported on the basis of 13% moisture. The 2016 samples were collected at the Fayette County, Calloway County, and Hancock County locations, and analyzed with a NIR spectrophotometer (DA 720, Perten Instruments, Sweden). The data were analyzed with Agrobase GEN II statistical software.

Interpretation

An important step in profitable soybean production is selecting good quality seed of the best varieties for each management system. The Kentucky Soybean Variety Performance Tests are conducted to provide information useful in making this selection.

Performance of soybean varieties is affected by many factors, including year, location, soil type, and time of planting. A particular soybean variety is adapted for full-season growth in a band approximately 100 miles wide from north to south. Thus,

the best variety in northern Kentucky may not be the best in southern areas. For this reason, the Kentucky Soybean Variety Performance Tests are conducted at several locations in the major soybean-producing areas of the state. The yields as reported in this publication should be used for relative comparisons; actual yields on a grower's farm may be different.

Performance of soybean varieties will vary from year to year and from location to location depending on adaptability, weather conditions, and management practices. Performance of a variety across a period of years and at several locations in the state is the best indicator of its production potential (see the University of Kentucky publication *Agronomy Notes*, Volume 21, No. 3, "Using Performance Test Results in Soybean Variety Selection in Kentucky"). The data presented in the Table 5, (State summary) have been averaged across years and locations and are recommended to evaluate variety relative performances.

Small differences in yield are usually of little importance. The yield of two varieties at a single location can differ because of chance factors (difference in soil characteristics, fertility, or availability of moisture), although the inherent yielding ability is the same. To decide if an observed yield difference is real, the least significant difference (LSD) values cited at the bottom of each maturity group should be used. The significance level in Tables 5 through 13 is 0.10. If the difference in yield between two varieties is greater than the LSD value, it is reasonable to assume that the varieties do differ in yielding ability.

Yield is only one factor to consider in selecting a variety for a production system. Oil and protein contents, date of maturity, lodging resistance, disease resistance, availability of time and equipment, economic management, and weed control costs should be considered as well.

Varieties with oil and protein levels that are eligible for premium prices are available in some markets. Oil and protein levels are influenced by variety and weather (primarily temperature) during seed filling (see UK's *Corn & Soybean Newsletter*, Volume 6, Issue 1, "Soybean Oil and Protein"). We recommend that growers create a list of varieties that meet their needs for agronomic characteristics: yield, maturity group, soybean cyst nematode resistance, etc. Then, using the protein and oil data from Table 5, they should remove from consideration the varieties with below-average oil and protein percentages from their list and select from the remaining ones those that have the highest average

concentrations. This approach should help select a variety that has the best chance of producing acceptable yield and that meets the oil and protein standards.

The data provided have been divided into maturity groups based on the information provided by the seed sources. Due to weather patterns at a location, maturity alone can affect yield; this impact will be reflected by large differences in the maturity group averages. Selecting varieties from several maturity groups can reduce the impact of these maturity group fluctuations (see UK's *Agronomy Notes*, Volume 25, No. 3, "Growing Soybean Varieties from Multiple Maturity Groups Can Reduce Yearly Yield Volatility"). The date of a 50% chance of a fall killing frost is important in determining which variety should be planted. The dates, presented along with Tables 6 through 13, are average dates over a long term. Actual dates will vary from year to year. For the dates of a one-year-out-of-10 chance of a fall killing frost, subtract 13 to 18 days from the dates. For maximum yield, a variety must mature before the first killing frost in the fall. The relative maturity for each variety is found in Table 3.

In case of known soybean cyst nematode (SCN) problems, a resistant variety should be used in the production system with a recommended crop rotation program (see Kentucky Cooperative Extension Service publication PPA-42: *Soybean Cyst Nematode*). The importance of resistant varieties has increased as the number of acres affected by SCN in Kentucky has increased. SCN occurs in 51 western Kentucky counties. Low levels of SCN show few visible symptoms but can cause yield losses of up to 25%. Fields should be tested for SCN. Producers should contact their local University of Kentucky County Extension office for more information on collecting and submitting samples.

Table 5, consisting of a summary of the 2014-2015-2016 full-season tests for each maturity group, is recommended for selecting varieties for maximum yield in double-crop systems and in full-season systems in Kentucky. Better yielding full-season varieties are also the better-yielding double-crop varieties (Pfeiffer, Todd 1987. *Applied Agricultural Research*, Vol. 2, No. 3, pp. 141-145). The full-season environment that maximizes yield is a better indicator of performance than late-planted soybeans that have reduced yields. The data from three full-season tests, analyzed across years and locations, predict performance of a variety more accurately than a single, full-season, or double-crop test.

Growing Conditions and Special Circumstances—2016

February saw near normal temperatures and above normal rainfall. The month started out very active as a strong storm system pushed through the Lower Ohio Valley with temperatures in the upper 60s to low 70s (normal highs for February are in the low to mid 40s). Another significant winter storm came on the 14th with totals ranging from 2 to over six inches across the area, with highest accumulations across the southern half of Kentucky. Activity then increased over the latter half of February with multiple rounds of widespread activity. The 2015-2016 winter was one of the warmest on record for the state of Kentucky.

March was also above normal temperatures over a period of three weeks. The average state temperature of 61 degrees was 16 degrees above normal for this time of year. Over this period, a low pressure system sat over northern Mexico and Texas, setting up a southerly flow pattern into the Ohio Valley. Temperatures for the period averaged 53 degrees across the state which was 6 degrees warmer than normal. In addition to the extremely warm temperatures seen over the second week of the month, rainfall was abundant across the western half of the state.

April started off with a couple rounds of widespread showers and storms as low pressure passed through the area. Conditions then turned dry, with around 55% of the state showing signs of abnormally dry conditions, mainly in east-central and southeastern Kentucky. By the last week of April the entire state experienced some rainfall. Exceptionally wet conditions soaked the ground. Temperatures for the period averaged 58 degrees across, 2 degrees warmer than normal.

After an exceptionally wet end to April, the active pattern remained in place for much of May, which is typically the wettest month of the year for Kentucky. The entirety of the state averaged over 5 inches of rainfall. The active period occurred between the 10th and the 12th. Strong to severe storms were seen each day with excessive lightning, heavy rain, large hail, and damaging winds as the main hazards. By mid-May, standing water was being seen in many fields. Behind northwest flow, most of the state exceeded the 10% threshold for freezing occurrence, with temperatures dropping into the middle 30s to low 40s by the 15th, 15 to 20 degrees below normal for mid-May. The last week of the month brought a drastic change to this

pattern as it started to feel more like summer. Through the last week, temperatures were in the 80s about each day, along with an increase in humidity as Gulf moisture filtered into the area. Precipitation for the period totaled 6.03 inches statewide which was 1.11 inches above normal and 122% of normal.

June was dry and warm, 12 degrees warmer than May. June had over one inch below normal. The cool, wet conditions of May 2016 slowed crop planting (corn, soybean) but also emergence/development. Then the dry June caused crops to start showing some stress, especially in western and west central regions. The west only received 61 per cent of normal monthly rainfall. Temperatures for the period averaged 75 degrees across the state which was 2 degrees warmer than normal. Precipitation for the period totaled 3.34 inches statewide which was 1.06 inches below normal and 76% of normal.

July 2016 was an exceptionally wet month with an average of 8.86 inches, only slightly behind 2015. Western Kentucky alone averaged 12.43 inches. Most of the rainfall fell over the first and last weeks of July, with below normal rainfall in between. Any storms that did develop were heavy-rain producers as the state remained entrenched in a humid air mass for much of July. The heavy rain at the start of the month left many low lying fields in standing water and resulted in crop losses for tobacco, corn, and soybeans. Temperatures remained above normal for each week of July. Between the 18th and 24th, the state saw a prolonged period of heat. Temperatures for the period averaged 78 degrees across the state which was 2 degrees warmer than normal.

The wet summer trend continued through much of the month of August. The state averaged nearly 5 inches for the month, which was over an inch above normal. Several rounds of storms pushed through the Commonwealth. Storms were capable of torrential rainfall and occasional localized flooding. After a very active period, the final week and half of August were fairly dry with showers and scattered storms. The hot and muggy conditions continued. Throughout the month, temperatures remained elevated, peaking in the middle 90s at times. Temperatures for the period averaged 78 degrees across the state which was 2 degrees warmer than normal.

A dry pattern developed in September, with an average of 2 inches of rain for the state. Weak, passing cold fronts brought few precipitations. By the end of the month,

the Bluegrass area and southern part of the state was considered under abnormally dry conditions. Temperatures also remained above seasonal, with high temperatures rising into the low to mid-90s throughout September. Temperatures averaged 72 degrees across the state. These conditions favored harvest.

Dry conditions continued in October. The state averaged just 0.99 inches of rain for the month, which was over 2 inches below normal, which added to the September deficit. The first update of U.S. Drought Monitor on November 1st showed nearly 82% of the state under a 'moderate drought'. Soybean harvest progressed rapidly, but the dry conditions were detrimental to other agricultural production systems such as pasture feeding for livestock and contributed to poor germination of wheat and cover crops. Temperatures remained fairly warm for October, reaching mid- to upper 80s.

More detailed precipitation and temperature information for each test location is provided next to Tables 6 through 13, in the sections Agronomic Information (Sources: www.kymesonet.gov, www.nws.noaa.gov, and wwwagwx.ca.uky.edu/annual.shtml).

Soybean Production Information

The Kentucky Cooperative Extension Service has a series of publications, Soybean Production in Kentucky, which contains a more detailed discussion of soybean production practices:

- AGR-128: *Status, Uses, and Planning (Part I)*
- AGR-129: *Seed Selection, Variety Selection, and Fertilization (Part II)*
- AGR-130: *Planting Practices and Double Cropping (Part III)*
- AGR-131: *Weed, Disease, and Insect Control (Part IV)*
- AGR-132: *Harvesting, Drying, Storage, and Marketing (Part V)*

Table 2 is a seeding rate planting guide for full-season and double-crop soybeans. For additional research on seeding rates, see the *Corn & Soybean News*, Volume 6, Issue 2 ("Soybean Population and Yield"), and Volume 7, Issue 4 ("Soybean Seed Rates"). The most recent research suggests that a final stand of 100,000 plants per acre is adequate for maximum yields in full-season soybeans in most situations. Seeding rates should be adjusted on standard germination rates as well as expected stand losses. Stand losses are typically more severe in damp, cool conditions with heavy residues or with soil crusting. Stand losses are typically less with

warm conditions and adequate soil moisture.

As of November 9, 2016, soybean production for Kentucky was forecast at 89.5 million bushels, unchanged, up 1% from 2015. Yield was estimated at 50 bushels per acre. Acreage for harvest was estimated at 1.79 million acres, down 20,000 acres from 2015. Soybean average price reached \$9.86 per bushel for Kentucky in September (Source: November Crop Production—News Release USDA NASS, November 9, 2016; Kentucky AgriNews 35(11) USDA NASS, November 15, 2016).

Kentucky State Seed Law

The Kentucky State Seed Law requires all seed exposed, offered for sale, or sold in Kentucky to be labeled as to a) kind and variety for each agricultural seed component present in excess of 5% of the whole, and b) the percentage by weight of each component. All soybean seed blends should be labeled as to the percentage of each variety that makes up the mixture. All soybean seed must be labeled by variety name; the term "variety unknown" may no longer be used in place of a variety designation for soybeans.

A This information is provided by the seed companies and has not been verified by the soybean variety performance test program

B Bolt: enhanced tolerance to DuPont™ LeadOff® and DuPont™ Basis® Blend herbicides variety; CONV: conventional soybean variety; GENRR2, RR2, R2Y: Roundup Ready 2 Yield soybean variety (introduced in 2009); LL: Liberty Link herbicide (glufosinate ammonium) tolerant soybean variety (introduced in 2009); P: Public variety; RR, RR1: Roundup Ready Variety (first generation - original trait released in 1996); STS: sulfonylurea herbicide tolerant soybean variety (introduced in 1994); SR: sulfonylurea resistant soybean variety; XTEND, Xtend, Extend, XT: dicamba tolerant soybean variety

C Blank spaces = no information provided by seed companies, or information unknown; S = susceptible, MS = moderately susceptible, MT = moderately resistant, T = tolerant, MR = moderately resistant, R = resistant

D All races of Phytophtora sojae so far identified in Kentucky can be controlled with varieties in the Rps 1c or 1k. Race-specific resistance is highly effective, but requires a proper match between pathogen race and variety. Field tolerance is a lower level of protection that will provide good control against all races. Seed and young seedlings of tolerant varieties must be protected with an appropriate fungicide since field tolerance develops after early seedling growth stages.

Table 4. Seed Treatments.

Name (treatment combination)	Treatment	Chemical class/use	LD50 oral/ derm A	LC50B
1 Allegiance & Meta Star ST	Metalaxyl	systemic fungicide	2,900/2,000	21.94 - 1hr
2 Acceleron (1, 10, 11)	Metalaxyl, Imidacloprid, Pyraclostrobin	systemic & non-systemic fungicide, systemic insecticide	NA	NA
3 Apron XL	Mefenoxam	systemic fungicide	862/2,020	2.52 - 4hrs
4 Apron Maxx (3, 12)	Mefenoxam, Fludioxonil	systemic & non-systemic fungicide	5,000/5,050	5.42 - 4hrs
5 Cruiser Maxx (3, 5, 12)	Mefenoxam, Thiamethoxam, Fluodioxinil	systemic & non-systemic fungicide, systemic insecticide	5,000/ 5,000	2.5 - 4hrs
6 Cruiser Extreme (6, 8)	Mefenoxam, Thiamethoxam, Fludioxonil, Azoxystrobin	systemic & non-systemic fungicide, systemic insecticide	5,000/ 5,050	NA
7 Gaucho	Imidacloprid	systemic insecticide	643/ 2,000	8.1 to 10.0 - 1hr
8 Trilex®	Trifloxystrobin	systemic fungicide	5,000/5,000	2.6 - 4hrs
9 Rancona 3.8 FS	Ipcnazole	systemic broad-spectrum fungicide	5,000/slight	2.59 - 4hrs
10 Escalate (3, 12, 16, 10)	Mefenoxam, Fludioxonil, Thiram, Imidacloprid	systemic & non-systemic fungicide, systemic insecticide	640/2,000	NA
11 Agri Star® Macho® 600 ST (10)	Imidacloprid	systemic insecticide	4,500/2,000	5.0 - 4hrs
12 Poncho® VOTIVO®	Clothiandin, <i>Bacillus firmus</i>	systemic insecticide and nematicide	2,000/5,000	2.62 - 4hrs
13 Vibrance™	Sedaxane	fungicide	2,975/5,050	2.56 - 4hrs
14 Xemium®	Fluxapyroxad	broad spectrum fungicide	2,000/2,000	5.10 - 4hrs
15 Trilex® 2000	Trifloxystrobin, Metalaxyl, Glycerine	systemic fungicide	2,000/5,000	2.6 - 4hrs
16 Clariva™ Complete Beans	<i>Pasteuria nishizawae</i> , Mefenoxam, Thiamethoxam, Fluodioxinil, Sedaxane	nematicide, systemic & non-systemic fungicide, systemic insecticide	see 5 & 13	see 5 & 13
17 ILeVO®	Fluopyram	fungicide, nematicide	1,750/5,000	2.0 - 96hrs
18 Eclipse TEN	Metalaxyl, Fludioxonil, Thiabendazole, Imidacloprid	systemic & non-systemic fungicide	NA	NA
19 TagTeam® LCO liquid	<i>Penicillium bilaii</i> , <i>Bradyrhizobium japonicum</i>	beneficial microorganisms	NA	NA
20 N-Habit™ CST	Harpin protein	activates a natural defense mechanism in plants, referred to as systemic acquired resistance	NA	NA
21 Stine XP		fungicide		
22 Avicta Complete Beans	Abamectin, Thiamethoxam , Mefenoxam , Fludioxon	nematicide, insecticide & fungicide	97.83/5,000	0.055-0.50 - 4hrs
23 EverGol™ Energy	Prothioconazole, Penflufen, Metalaxyl, Polyethylene-polypropylene copolymer, 1,2-Propanediol	fungicide	2,000/2,000	2,205 - 4hrs
24 PPST 2030	premium on-seed inoculant plus extender product - Pioneer	beneficial microorganisms	NA	NA
25	Rancona (9), Thiabendazole, Azoxystrobin	systemic broad-spectrum fungicide, systemic & non-systemic fungicides	NA	NA
26 AgriShield® Fungicide + Insecticide with Clariva®		nematicide, insecticide & fungicide		
27	Thiabendazole			
28 PA2030		Biological Component	NA	NA
29 Excalibre-SA™	<i>Bradyrhizobium japonicum</i>	beneficial microorganisms	NA	NA

A/B The LD50 and LC50 are standardized measures for expressing and comparing the toxicity of chemicals.

A The LD50 is expressed as mg of chemical per kg (2.2 lbs.) body weight of test animal.

B The LC50 is expressed as mg of chemical per liter of air inhaled by test animal.

The LD50 and LC50 are the doses that kill half (50%) of the animals tested (LD = "lethal dose", LC = "lethal concentration").

The LD50 and LC50 data are from MSDS (Material Safety Data Sheet).

[2016 protein and oil samples collected in Calloway Co., Hancock Co., and Fayette Co. - analyzed data will be provided ASAP]

A Within a maturity group, shaded yield are not significantly different (0.10) from the highest yielding cultivar (bold) of that maturity group and year column.

B 2016 yield data were collected at the Breckinridge Co., Butler Co., Caldwell Co., Calloway Co., Cumberland Co., Fayette Co., Hancock Co., and Russell Co. locations. The 2015 yield data were collected at the Breckinridge Co., Butler Co., Caldwell Co., Calloway Co., Clinton Co., Fayette Co., Hancock Co., and Pulaski Co. locations. The 2014 yield data were collected at the Caldwell Co., Calloway Co., Daviess Co., Fayette Co., Hardin Co., and Simpson Co. locations.

C 2016 oil and protein samples were collected at the Calloway Co. (except for MG IV Early and Late samples), Hancock Co., and Fayette Co. locations. The 2015 samples were collected at the Fayette Co., Hancock Co., and Pulaski Co. locations. The 2014 samples were collected at the Caldwell Co., Fayette Co., and Simpson Co. locations.

D MG II: no varieties entered in 2016 matched the varieties entered in 2014

^A Within a maturity group, shaded yield are not significantly different (0.10) from the highest yielding cultivar (bold) of that maturity group and year column.
^B 2016, 2015 data were collected in Breckinridge Co. 2014 data were collected in Hardin Co.
^C MG II: no varieties entered in 2016 matched the varieties entered in 2014.

AGRONOMIC INFORMATION

Soil type	Nolin Silt Loam
Previous crop	Soybean
Soil test	pH 6.34, P 121, K 237
SCN test	375
Fertilizer/lime applied	NA
Agricultural practice	No-till
Pre-planting treatments	none
Planting date (all maturity groups)	6/10/2016
Post-planting treatments	Verdict, Glyphosate: 6/11/2016 First Rate, Reflex: 6/30/2016
Harvest dates	MG II, III, IV Early: 10/12/2016 MG IV Late, V: 11/02/2016
50% chance of killing frost	10/22

^A Within a maturity group, shaded yield are not significantly different (0.10) from the highest yielding cultivar (bold) of that maturity group and year column.

^B 2016, 2015 data were collected in Butler Co. 2014 data were collected in Simpson Co.

^C MG II: no varieties entered in 2016 matched the varieties entered in 2014.

AGRONOMIC INFORMATION

Soil type	Melvin Silt Loam
Previous crop	Corn
Soil test	pH 5.54, P 30, K 177
SCN test	0
Fertilizer/lime applied	None
Agricultural practice	No-till
Pre-planting treatments	Glyphosate, Authority XL: 06/07/2016
Planting date (all maturity groups)	6/8/2016
Post-planting treatments	Intensity One, Classic 25DF: 7/19/2016
Harvest dates	MG II, III, IV Early, V: 10/18/2016 MG IV Late: 10/19/2016
50% chance of killing frost	10/20

A Within a maturity group, shaded yield are not significantly different (0.10) from the highest yielding cultivar (bold) of that maturity group and year column.

B 2016, 2015, and 2014 data were collected in Calloway Co.

C MG II: no varieties entered in 2016 matched the varieties entered in 2014.

AGRONOMIC INFORMATION

Soil type	Grenada Silt Loam
Previous crop	Tobacco
Soil test	pH 6.13, P 55, K 224
SCN test	0
Fertilizer/lime applied	P2O5 K2O 30/50 lbs/acre
Agricultural practice	Tillage
Pre-planting treatments	NA
Planting dates	MG II and III: 5/23/2016
Post-planting treatments	MG IV Early, IV Late, V: 5/24/2016
Harvest dates	Intensity One (back pack): 7/11/2016
50% chance of killing frost	MG II, III: 09/27/2016 MG IV Early: 9/28/2016 MG IV Late, V: 10/17/2016 10/30

^A Within a maturity group, shaded yield are not significantly different (0.10) from the highest yielding cultivar (**bold**) of that maturity group and year column.

^B 2016 data were collected in Cumberland Co. 2015 data were collected in Clinton Co. No data were collected in 2014.

AGRONOMIC INFORMATION

Soil type	Huntington Silt Loam
Previous crop	Fallow (2 years)
Soil test	pH 5.68, P 26, K 131
SCN test	0
Fertilizer/lime applied	None
Agricultural practice	No-till
Pre-planting treatments	NA
Planting date (all maturity groups)	5/14/2016
Post-planting treatments	Mad Dog, First Rate, Prefix: 5/16/2016 First Rate, Classic 25DF, Intensity One: 6/29/2016
Harvest dates	MG II: 09/29/2016 MG III, IV Early: 10/06/2016 MG IV Late, V: 10/31/2016
50% chance of killing frost	10/24

^A Within a maturity group, shaded yield are not significantly different (0.10) from the highest yielding cultivar (**bold**) of that maturity group and year column.

^B 2016 data were collected in Russell Co. 2015 data were collected in Pulaski Co. No data were collected in 2014.

AGRONOMIC INFORMATION

Soil type	Sango Silt Loam
Previous crop	Soybean
Soil test	pH 6.21, P 263, K 213
SCN test	1125
Fertilizer/lime applied	NA
Agricultural practice	No-till
Pre-planting treatments	Touchdown, Spartan, FirstRate (late May)
Planting date (all maturity groups)	5/31/2016
Post-planting treatments	None
Harvest dates	MG II, III: 10/03/2016 MG IV Early, IV Late: 10/04/2016 MG V: 10/26/2016
50% chance of killing frost	10/24
